Advances in the Geological Storage of Carbon Dioxide S. Lombardi,L.K. Altunina,S.E. Beaubien,2006-01-13 As is now generally accepted mankind's burning of fossil fuels has resulted in the mass transfer of greenhouse gases to the atmosphere a modification of the delicately balanced global carbon cycle and a measurable change in world wide temperatures and climate Although not the most powerful greenhouse gas carbon dioxide CO₂ drives climate change due to the enormous volumes of this gas pumped into the atmosphere every day Produced in almost equal parts by the transportation industrial and energy generating sectors atmospheric CO₂ concentrations have increased by about 50% over the last 300 years and according to some sources are predicted to increase by up to 200% over pre industrial levels during the next 100 years If we are to reverse this trend in order to prevent significant environmental change in the future action must be taken immediately While reduced use of fossil fuels through conservation increased efficiency and expanded use of renewable energy sources must be our ultimate goal short to medium

term solutions are needed which can make an impact today Various types of CO storage techniques have been proposed to fill this 2 need with the injection of this gas into deep geological reservoirs being one of the most promising For example this approach has the potential to become a closed loop system whereby underground energy resources are brought to surface their energy extracted via burning or hydrogen extraction and the resulting by products returned to the subsurface

Radiation Therapy of Head and Neck Cancer George E. Laramore,2012-12-06 The contemporary management of patients with cancers of the head and neck is under careful scrutiny and major changes are being introduced in order to improve the potential not only for long term control but also for less in the way of disfiguring and distressing complications associated with the treatment programs In 1988 the American Cancer Society estimates that there will be 42400 new cases of malignant tumors of the head and neck diagnosed with 12 850 deaths In general the prognosis for patients with malignant tumors of the head and neck region depends upon the site of origin the local and regional extent of the tumor the Karnofsky status of the patient as well as the patient's general medical condition The potential for cure for early stage tumors is extremely high particularly for those lesions involving the vocal cord oral cavity and the anterior two thirds of the tongue Major advances have been made in the management of head and neck cancer by the innovative utilization of surgery with radiation therapy Small tumors can be cured by either surgery or radiation therapy with equally good results However far advanced tumors are more complicated and more difficult to cure requiring combined integrated multimodal programs of management Therefore the previously general poor prognosis for advanced tumors is becoming better with more aggressive treatment regimens **Carload Waybill Statistics** United States.
