**Reconstructive Phase Transitions** Pierre Tolédano, Vladimir Dmitriev, 1996 This book deals with the phenomenological theory of first order structural phase transitions with a special emphasis on reconstructive transformations in which a group subgroup relationship between the symmetries of the phases is absent It starts with a unified presentation of the current approach to first order phase transitions using the more recent results of the Landau theory of phase transitions and of the theory of singularities A general theory of reconstructive phase transitions is then formulated in which the structures surrounding a transition are expressed in terms of density waves providing a natural definition of the transition order parameters and a description of the corresponding phase diagrams and relevant physical properties The applicability of the theory is illustrated by a large number of concrete examples pertaining to the various classes of reconstructive transitions allotropic transformations of the elements displacive and order disorder transformations in metals alloys and related structures crystal quasicrystal transformations
