Magnetohydrodynamics with Complex Boundaries and Free Surfaces Jie Zhang, 2018-12-16 This thesis presents an accurate
and advanced numerical methodology to remedy difficulties such as direct numerical simulation of magnetohydrodynamic
MHD flow in computational fluid dynamics CFD grid generation processes in tokamak fusion facilities and the coupling
between the surface tension force and Lorentz force in the metallurgical industry In addition on the basis of the numerical
platform it establishes it also investigates selected interesting topics e g single bubble motion under the influence of either
vertical or horizontal magnetic fields Furthermore it confirms the relation between the bubble s path instability and wake
instability and observes the anisotropic isotropic effect of the vertical horizontal magnetic field on the vortex structures
which determines the dynamic behavior of the rising bubble The direct numerical simulation of magnetohydrodynamic MHD
flows has proven difficult in the field of computational fluid dynamic CFD research because it not only concerns the coupling
of the equations governing the electromagnetic field and the fluid motion but also calls for suitable numerical methods for
computing the electromagnetic field In tokamak fusion facilities where the MHD effect is significant and the flow domain is
complex the process of grid generation requires considerable time and effort Moreover in the metallurgical industry where
multiphase MHD flows are usually encountered the coupling between the surface tension force and Lorentz force adds to the
difficulty of deriving direct numerical simulations **Russian Economic Development over Three Centuries** Masaaki
