Syntactic and Structural Pattern Recognition Gabriel Ferrate,Theo Pavlidis,Alberto Sanfeliu,Horst Bunke,2012-12-06 Thirty years ago pattern recognition was dominated by the learning machine concept that one could automate the process of going from the raw data to a classifier The derivation of numerical features from the input image was not considered an important step One could present all possible features to a program which in turn could find which ones would be useful for pattern recognition In spite of significant improvements in statistical inference techniques progress was slow It became clear that feature derivation was a very complex process that could not be automated and that features could be symbolic as well as numerical Furthennore the spatial relationship amongst features might be important It appeared that pattern recognition might resemble language analysis since features could play the role of symbols strung together to form a word This led to the genesis of syntactic pattern recognition pioneered in the middle and late 1960 s by Russel Kirsch Robert Ledley Nararimhan and Allan Shaw However the thorough investigation of the area was left to King Sun Fu and his students who until his untimely death produced most of the significant papers in this area One of these papers syntactic recognition of fingerprints received the distinction of being selected as the best paper published that year in the IEEE Transaction on Computers Therefore syntactic pattern recognition has a long history of active research and has been used in industrial applications

Pattern Recognition in Speech and Language Processing Wu Chou,Biing-Hwang Juang,2003-02-26 Over the last 20 years approaches to designing speech and language processing algorithms have moved from methods based on linguistics and speech science to data driven pattern recognition techniques These techniques have been the focus of intense fast moving research and have contributed to significant advances in this field Pattern Reco
