Advances in Neutron Capture Therapy A.H. Soloway, R.F. Barth, D.E. Carpenter, 1993 Binary systems for the treatment of cancer potentially are among the most attractive of the new therapeutic modalities that currently are under investigation The basic concept is to selectively destroy malignant cells while concomitantly sparing normal tissue Neutron capture therapy NCT is the binary system that has been the subject of the Fifth International Symposium on Neutron Capture Therapy which was held September 13-17 1992 in Columbus Ohio under the auspices of the International Society for Neutron Capture Therapy Its objective was to bring together researchers from throughout the world and to provide a forum at which they could present the latest advances in the development of Neutron capture therapy Neutron capture therapy has largely but not exclusively focused on the use of boron 10 as the target nuclide Boron neutron capture therapy BNCT is based on the nuclear reaction that occurs when the stable isotope boron 10 absorbs low energy non ionizing thermal neutrons to yield alpha particles and recoiling lithium 7 nuclei The size and energy of these high linear energy transfer LET particles result in their being confined largely to the cells in which the capture reaction occurs For BNCT to be successful a sufficient number of ^{10}B atoms must be localized within neoplastic cells and enough thermal neutrons must be delivered and absorbed by the ^{10}B to produce a lethal $^{10}\text{B}(n,\alpha)^7\text{Li}$ reaction Two major problems must be surmounted
