Coal Combustion and Gasification L. Douglas Smoot, Philip J. Smith, 2013-11-11 The use of coal is required to help satisfy the world's energy needs. Yet coal is a difficult fossil fuel to consume efficiently and cleanly. We believe that its clean and efficient use can be increased through improved technology based on a thorough understanding of fundamental physical and chemical processes that occur during consumption. The principal objective of this book is to provide a current summary of this technology. The past technology for describing and analyzing coal furnaces and combustors has relied largely on empirical inputs for the complex flow and chemical reactions that occur while more formally treating the heat transfer effects. Growing concern over control of combustion-generated air pollutants revealed a lack of understanding of the relevant fundamental physical and chemical mechanisms. Recent technical advances in computer speed and storage capacity and in numerical prediction of recirculating turbulent flows, two-phase flows, and flows with chemical reaction have opened new opportunities for describing and modeling such complex combustion systems in greater detail. We believe that most of the requisite component models to permit a more fundamental description of coal combustion processes are available. At the same time, there is worldwide interest in the use of coal, and progress in modeling of coal reaction processes has been steady.

Committee on Agriculture. Subcommittee on Livestock, Dairy, and Poultry, 1991 [Pulverized-Coal Combustion and Gasification](#) L. Smoot, 2013-04-17 viii and approaches could be adapted to other coal conversion and combustion problems we have not considered: combustion or gasification in fluidized or fixed beds or in situ processes. In addition, we have not considered other fossil fuel combustion problems associated with oil shale, tar sands, etc., even though many aspects of pulverized coal combustion would relate to these problems. For the case of pulverized coal models, we have attempted to provide a detailed description of the model foundations. Parts I and II of this book emphasize general principles for describing reacting turbulent or laminar multiphase systems. General conservation equations are developed and summarized. The basis for computing thermochemical equilibrium in complex heterogeneous mixtures is presented together with techniques for rapid computation and reference to required input data. Rate processes are then discussed, including pertinent aspects of turbulence, chemical kinetics, radiative heat transfer, and gas-particle convective-diffusive interactions. Much of Part II deals with parameters and coefficients for describing these complex rate processes. This part of the book provides recommended values of coefficients and parameters for treating complex reacting flows. Parts I and II may well be suitable for use in an advanced course in reacting flows and have been written partly with that in mind. Part III deals with more specific aspects of pulverized coal characteristics and rate processes. Following a general description of coal structure and constitution, coal pyrolysis and char oxidation processes are considered.
